

The atmosphere: atmospheric pressure

CONCEPT REVIEW 29
Complete this concept review handout and keep it as a record of what you have learned.

Definitions

- The atmosphere is the layer of air surrounding the Earth.
 - Air is the mixture of gases, especially nitrogen and oxygen, that makes up the atmosphere.
 - Atmospheric pressure is the pressure of the air in the atmosphere.
- Unit of measurement: kilopascal Symbol: kPa

Role of the atmosphere in maintaining life on Earth

- It blocks out dangerous rays from the sun, such as ultraviolet rays.
- It retains heat, ensuring a relatively stable climate on Earth.
- The oxygen and carbon dioxide it contains make cellular respiration and photosynthesis possible.

Composition of the atmosphere

Oxygen (O_2)

Other gases. Examples:

- Argon
- Water vapour
- Carbon dioxide

Nitrogen (N_2)

Name: _____ Class: _____ Date: _____

Layers of the atmosphere

Layer	Altitude	Distinctive features
Exosphere	500 km and more	<ul style="list-style-type: none"> • Air is very rare. • Most satellites are found here.
Thermosphere	80–500 km	<ul style="list-style-type: none"> • The hottest layer of the atmosphere, temperatures climb to 1800°C. • Shooting stars and polar auroras form here.
Mesosphere	50–80 km	<ul style="list-style-type: none"> • The coldest layer, temperatures fall to -80 °C. • Air particles are very sparse.
Stratosphere	15–50 km	<ul style="list-style-type: none"> • The ozone layer, which absorbs UV rays, is here. • Temperatures rise with altitude.
Troposphere	0–15 km	<ul style="list-style-type: none"> • Most meteorological phenomena occur here. • Temperatures drop with altitude.

Factors affecting atmospheric pressure

Factor	Variation in the factor	Effect
Number of air particles	Increase	<ul style="list-style-type: none"> • Atmospheric pressure rises.
	Decrease	<ul style="list-style-type: none"> • Atmospheric pressure falls.
Temperature of air particles	Increase	<ul style="list-style-type: none"> • Particles move away from one another and the air tends to rise. • A low-pressure area forms.
	Decrease	<ul style="list-style-type: none"> • Particles move closer together and the air tends to fall. • A high-pressure area (anticyclone) forms.

- Prevailing winds are major atmospheric currents that blow in a general direction.
- An air mass is a large expanse of the atmosphere with relatively uniform temperature and humidity.
- A cyclone is a tropical storm characterized by violent winds revolving around an area of low pressure.

Atmospheric circulation cells

Cell	Location	Movement of air
Hadley cell	<u>Between the equator and the 30th parallel</u>	<ul style="list-style-type: none"> • Air over <u>the equator</u>, rises into the atmosphere. • It gradually <u>cools</u> as it travels toward the 30th parallel. • It runs into winds from the Ferrel cell, descends and returns to <u>the equator</u>.
Ferrel cell	<u>Between the 30th and 60th parallels</u>	<ul style="list-style-type: none"> • Part of the air approaching the 30th parallel surges toward <u>the poles</u>. • Near the 60th parallel, this air collides with winds from <u>the Polar cell</u>. • The air rises and returns toward <u>the 30th parallel</u>.
Polar cell	<u>Between the 60th parallel and a pole</u>	<ul style="list-style-type: none"> • The temperature of the air drops to its <u>minimum</u> over <u>the poles</u>. • The air sinks to the Earth and then turns toward <u>the 60th parallel</u>, where it collides with the Ferrel cell. • The air is forced to rise and return to <u>the poles</u>.

Prevailing winds

Winds	Location	Direction in the Northern Hemisphere
Polar easterlies	Between a pole and the 60th parallel	From northeast to southwest
Westerlies	Between the 60th and 30th parallels	From southeast to northeast
Trade winds	Between the 30th parallel and the equator	From northeast to southeast

Jet streams

<ul style="list-style-type: none"> Name: <u>Subtropical jet stream.</u> Speed: <u>Up to 400 km/h in winter.</u> Location: <u>Around the 30th parallel at an altitude of 11 000 to 14 000 m</u>
<ul style="list-style-type: none"> Name: <u>Polar jet stream.</u> Speed: <u>Up to 300 km/h in winter.</u> Location: <u>Around the 60th parallel at an altitude of 9000 to 10 000 m</u>

Characteristics of fronts

Name	Formation	Movement of air	Meteorological conditions
Cold front	When a mass of cold air meets a mass of warm air.	The warm air rises rapidly above the cold air.	<ul style="list-style-type: none"> Formation of puffy clouds (cumulus) Probability of wind and heavy rain
Warm front	When a mass of warm air meets a mass of cold air.	The warm air rises gently above the cold air.	<ul style="list-style-type: none"> Formation of light clouds (nimbostratus) Probability of cloudy weather and showers

Anticyclones and depressions

Name	Formation	Movement of air	Meteorological conditions
Anticyclone	Surrounds a high-pressure centre.	<ul style="list-style-type: none"> Clockwise rotation in the Northern Hemisphere Counterclockwise rotation in the Southern Hemisphere 	Clear sky and stable weather: <ul style="list-style-type: none"> Dry and sunny in summer Cold in winter
Depression	Surrounds a low-pressure centre.	<ul style="list-style-type: none"> Counterclockwise rotation in the Northern Hemisphere Clockwise rotation in the Southern Hemisphere 	<ul style="list-style-type: none"> Cloud formation Precipitation

- Climate change is the abnormal fluctuation of climate over human activity.
- The ozone layer is a part of the atmosphere with a high concentration of ozone molecules, which absorb some of the ultraviolet rays from the sun.
- Smog is a thick mixture of fog, smoke and atmospheric pollutants.
- Wind energy is the energy that can be drawn from the wind.

Factors leading to the intensification of the greenhouse effect

Greenhouse gas	Factors of natural origin	Factors linked to human activity
Carbon dioxide (CO ₂)	<ul style="list-style-type: none"> ● Forest fires ● Volcanic eruptions ● Cellular respiration 	<ul style="list-style-type: none"> ● Combustion of fossil fuels ● Clearing of land
Methane (CH ₄)	<ul style="list-style-type: none"> ● Digestion in wild animals ● Decomposing plants ● Swamps 	<ul style="list-style-type: none"> ● Digestion in farm animals ● Decomposing household waste ● Manure storage and management ● Distribution of natural gas ● Rice farming in paddy fields
Nitrous oxide (N ₂ O)	<ul style="list-style-type: none"> ● Bacteria in the soil and oceans 	<ul style="list-style-type: none"> ● Applying nitrogen-rich fertilizer ● Certain chemical processes

Some atmospheric contaminants

Contaminant	Consequence
Sulphur dioxide (SO ₂)	Acid rain, smog
Nitrogen oxides (NO _x)	Acid rain, smog
Metals (mercury, arsenic, lead)	Toxic for human health
Chlorofluorocarbons (CFCs)	Destruction of ozone molecules
Dust and airborne particles	Respiratory difficulties

Thinning of the ozone layer

Description of the ozone molecule (O ₃)	Cause of the thinning of the ozone layer	Ways to combat the thinning of the ozone layer
Molecule composed of three oxygen atoms existing as a gas.	Use of CFCs.	Montréal Protocol signed in 1987.

Smog

Formation of tropospheric ozone: Occurs when the Sun's rays hit nitrogen oxide molecules coming mainly from car exhaust or factories.

Formation of smog: Occurs when tropospheric ozone combines with other atmospheric pollutants, such as nitrogen dioxide or sulphur dioxide.

Consequences of smog: Forms a thick fog; leads to respiratory problems.

Advantages and disadvantages of wind turbines

Advantages
• Renewable resource
• No production of greenhouse gases
Disadvantages
• Visual pollution
• Impossibility of predicting when and where the wind will blow; wind energy cannot be stored.

Characteristics of the Sun

- Composition: 75% hydrogen and 25% helium.
- Temperature at the centre: 15 millions degrees Celsius.
- Form of energy emitted: Nuclear energy.

Types of solar ray making their way to the Earth's surface

- Infrared rays
- Visible light
- Ultraviolet rays

Technologies that put solar energy to use

Technology	Use	Characteristics
Passive heating systems	Heating of homes	<ul style="list-style-type: none"> • Positioning of windows toward the sun • Use of materials that absorb solar energy, such as concrete.
Photovoltaic cells	Supplying home appliances with electricity	<ul style="list-style-type: none"> • With the action of light, electrons contained in material are set in motion.
Solar collectors	Heating of buildings, and water in homes or swimming pools	<ul style="list-style-type: none"> • Capture, by glass panels, of the heat of the Sun's rays.

Advantages and disadvantages of solar energy

Advantages	Disadvantages
<ul style="list-style-type: none"> • Renewable source of energy. • Does not emit greenhouse gases. • Supplies electricity to isolated areas. 	<ul style="list-style-type: none"> • Costly system. • Amount of energy produced varies with the Sun's position and cloudy conditions.

- Tidal energy is the energy obtained from the ebb and flow of tides.

Characteristics of the Moon

- Average diameter: 3476 km
- Theory on its origins: The Moon is thought to have been formed following the reuniting of fragments produced by the collision of a large meteorite and the Earth.
- Duration of the Moon's rotation on its axis: 27.3 days.
- Duration of the Moon's revolution around the Earth: 27.3 days.

Tidal range

Definition	Factors influencing tidal range
Difference in water levels at low and high tide	<ul style="list-style-type: none"> • Shape and slope of the coastline • Depth of the water • Distance of the Moon or Sun from the Earth

Advantages and disadvantages of tidal power plants

Advantages	Disadvantages
<ul style="list-style-type: none"> • Renewable source of energy. • Reliable source of energy. • Does not emit greenhouse gases. 	<ul style="list-style-type: none"> • Complex plants. • Costly plants. • Suitable sites are rare (tidal range must be at least 5 m).
